

Quality Audit

User Guide · digital QA 343-34 shift audit form

A short guide to using the Quality Audit app. It works on a laptop in the office and on an iPad on the shop floor.

Open the app address in a browser (for example **http://csm-srv-16:5109**). No login is needed at the moment. Along the top there are five tabs: **New Audit**, **Dashboard**, **Coverage**, **History** and **Admin**.

New Audit

This is where you record a shift audit.

Screenshot: the New Audit machine list

- **Pick the area** – Sheet Metal or Assembly.
- **Fill in the header** – Date, Shift (1st / 2nd / 3rd), Auditor (pick your name), and Area / Line.
- **RAG guide** – the coloured box near the top explains what Green / Amber / Red mean and how often each must be checked. Tap RAG guide to collapse or show it.

Working through the machines

Each machine is one row. The coloured bar on the left is its severity for the week (Green, Amber = orange, Red). The number on the left is its position on the sheet, so repeated names stay separate. For each machine, tap one of the four result buttons:

- **OK** – meets standard, no problem found. This also ticks all the sub-checks and check points on that row as OK so they can be searched later. You can change any of them afterwards.
- **Not OK** – there is a deviation from standard.
- **No Time** – not audited because there was no time this shift.
- **Not Running** – not audited because the machine was not running.

Most machines pass, so use **Mark shown OK** to set every visible unchecked row to OK in one go, then go back and change the few that need attention.

Adding detail (tap the + on a row)

Screenshot: an expanded row with sub-checks and a photo

- Drawing / Part No., Customer, Action taken and a free-text detail box.
- **Sub-checks**: Plans in place & used, Destructive / NDT (Sheet Metal only), Area docs up to date.
- **Check points**: the Level 1/2/3 checklist for that machine's severity. Higher severity shows more. Ones marked (*if applicable*) are optional.
- **Deviation** – required whenever the result or any sub-check is Not OK. You cannot save until it is filled in.
- **Photos** – tap Add photo to use the iPad camera. Thumbnails show on the row and on the dashboard failure board.

For a Not OK, also choose an Action taken (e.g. 4-D report, Hold report) – recommended, not blocking. For No Time or Not Running, only the reason is recorded. To set the reason on many skipped rows at once, choose it in **Set reason for all Not Audited** and tap the button.

Filters and saving

- **Filters** – narrow the list by severity, area, Not checked, Failures or Not audited.
- **Save draft** – keeps an unfinished audit to come back to later in the shift.
- **Save & submit** – finishes the audit and shows a confirmation screen.

If you close the tab by accident, the app offers to **restore** your unsaved work. If an unfinished audit already exists for the same area, date and shift, it offers to **resume** it.

Screenshot: the confirmation screen

Dashboard

Screenshot: the dashboard with the attainment gauge

Pick a department, a week, and an attainment period (this week, this month, or rolling 12 months).

- **Attainment gauge** – the headline figure: audits completed against target (e.g. "3,253 of 4,500 audits – 72.3% against a 98% target"). Green at or above target, orange just below, red otherwise.
- **KPI tiles** – shifts logged, checks completed, pass rate, open failures.
- **Compliance against target** – actual vs expected checks per machine this week; under-target is highlighted.
- **This week vs last week** on the pass rate and failure tiles.
- **Failure board** – every Not OK, worst severity first, with deviation, customer, action and photos.
- **Charts** – failures by check point, failure rate by customer, pass rate by severity and area. Click a slice or bar to filter the failure board.
- **Wall display** – hides the menus and enlarges everything for the QA office TV.

Coverage

Screenshot: the coverage grid

A grid of every machine down the side and the days of the audit week (Tuesday to Monday) across the top. A count shows where a check was done. Machines that are **under target are listed first**. Use Prev week / Next week to move between weeks.

History

Screenshot: the history list

A list of past audits. Filter by department, shift and date range, or **search** the deviation and action text (e.g. "torque", "4-D"). Click a row to open a read-only copy of that audit. **12-month overview** shows the monthly pass/fail trend.

Admin

Only for admin users. Type your name in **Signed in as** at the top.

- **Weekly severity review** – pick a week (defaults to next Tuesday), set each machine to Red / Amber / Green, and Save all. Changes from the previous week are shown. This is the Monday risk review; it takes effect the following Tuesday.
- **Machines / Users / Customers / Check points / Action types** – add, edit or retire (retire hides them without deleting history).
- **Severity levels** – edit checks per week and the instruction text.
- **Department targets** – edit the target percentage the attainment gauge measures against.

Good to know

- The audit week runs Tuesday to Monday.
- Changing this week's severity or a colour never changes past figures.
- Colours and text come from the database, so admins can change them without a new release.
